

LIVE LUGGAGE  
POWER ASSISTED

## OPERATING INSTRUCTIONS FOR HANDLE

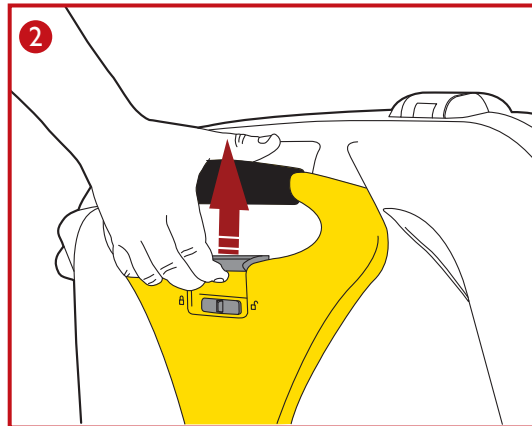

### PA Series Anti Gravity handle

The case is fitted with a unique patented Anti Gravity handle that allows 85% of the total weight to be transferred to the wheels, making your luggage vastly more transportable and manoeuvrable.

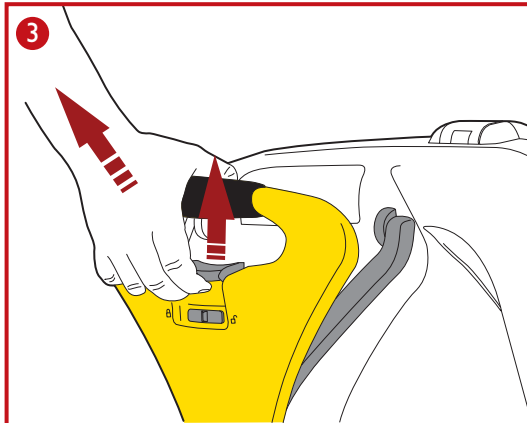

The handle is easily deployed and adjusted in height by depressing the latch within the handle grip (see below). The unique locking mechanism allows for 3 height settings to allow for personal requirements.

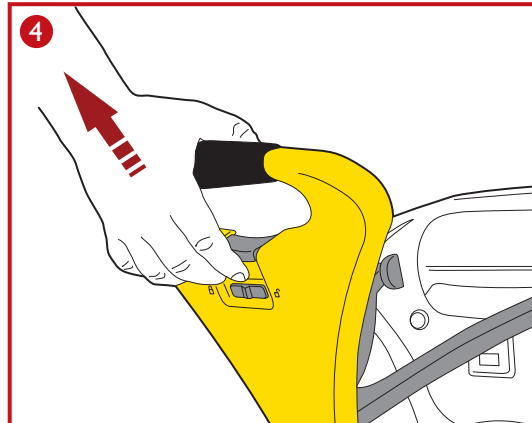

1. Slide handle lock to the unlock position.

2. Pull up handle latch to release the handle from the case body.

3. Continue to keep latch pulled up, then pull handle outwards and upwards.

4. Continue to pull handle outwards and upwards to required height setting.

*NB. The handle has a safety feature that stops it being pulled out fully if the latch is released before the handle reaches a distance of 6cm from the case body. This is to prevent the handle being fully opened accidentally. Should this happen, push the handle back into the body of the case and start again. (See points 1-3)*

#### To close:

Pull up handle latch to release locking mechanism. Keep pressure on the latch and push handle back into the case body. Handle will click into place. Slide handle lock to lock position.

because the world is not flat
